

KEYOU
emission-free technology.

Sustainable. Clean. Uncompromising.

KEYOU-inside
for Hydrogen Engines and Vehicles

“Our goal is to roll out emission-free hydrogen engines which are suitable for everyday use and economically viable at the same time”

KEYOU – Innovative Strength for Sustainable Mobility

Vision

Hydrogen produced from renewable energies is essential for the transition to a new, more sustainable energy paradigm and greener future. KEYOU's vision is to facilitate sustainable transport by road, rail, sea and air, today by developing zero-emission, low-cost H₂ combustion engine and vehicle technologies.

Company

KEYOU is YOUR KEY to innovative solutions for sustainable energy and clean mobility. Since 2015, we have been developing core components in drive technology; we are already presenting the engine of tomorrow today – the zero-emission hydrogen engine with KEYOU-inside!

Founder

KEYOU owes its innovative strength to the three founders: Thomas Korn, Alvaro Sousa and Ivo Pimentel. Thomas Korn and Alvaro Sousa are both engineers, with over 10 years of research and development of alternative drives at BMW. Ivo Pimentel completes the team's know-how, with his expertise in alternative energies. Together, they strive forward by exploring creative synergies and innovative concepts.

● Thomas Korn

● Alvaro Sousa

● Ivo Pimentel

Maximum
Performance.

Zero
Emission.

KEYOU-inside – Zero Emission Combustion Engines

Sustainable. Clean. Uncompromising.

KEYOU-inside combines the use of hydrogen as a sustainable fuel, with the proven and economical technology of the combustion engine, to create a quantum leap in drivetrain development. For the first time, there is an engine that is emission-free, cost-efficient and powerful at the same time – a technology with no compromises!

From concept to reality.

Today the public demands clean cities and affordable public transport. With KEYOU-inside for hydrogen engines, emission-free commercial vehicles are within reach and will soon become a reality on our streets. This emission-free technology has all the advantages of existing drive systems:

KEYOU-inside for your truck means:

- + **Similar driving ranges**
- + **High performance**
- + **High availability**
- + **Fast refueling**
- + **Proven suitability for everyday use**
- + **Convincing cost efficiency**
- + **Long service life**
- + **Zero Emissions**

“Diesel is the benchmark.
And we need to surpass it”

Groundbreaking – our Drivetrain Technology for Clean Mobility

Everyone is talking about climate protection – we are doing something about it

Climate protection is now also a public-health issue. It is no coincidence that discussions about driving bans and CO₂ reduction are so controversial. Urban and regional transport companies, fleet operators and politicians face a very difficult challenge: the search for affordable, ecological and everyday alternatives. However, the current focus on battery electric and fuel cell vehicles show clear weaknesses in affordability, range, availability or environmental balance. This is exactly what KEYOU is aiming to resolve.

KEYOU-inside technology profitably applied

We build on the robust and proven technology of the diesel engine. We then modify and transform it into an emission-free hydrogen engine. The engine base remains the same, but we increase efficiency and customer value. What makes the difference is our unique patented technology "KEYOU-inside" that enables clean and sustainable propulsion using hydrogen.

Convincing data – meaningful investment in the future

Our affordable KEYOU-inside technology guarantees high availability, ranges typical of commercial vehicles with correspondingly low consumption and the familiar heating and cargo cooling throughout the year.

Utility profile

using the example of a 18 t truck with KEYOU-inside

Range:	> 350 km
Output:	210 kW
Availability:	> 95 %
Service life:	> 700,000 km
Refueling time:	ca. 8 minutes
Payload capacity:	≈ 95 %
Cargo cooling:	Hydrogen
Emissions:	Only water vapor, no CO ₂
Noise emission	-20 % compared to diesel bus

Mobility and the Environment – New CO₂-Regulations by Law

CO₂ limits – EU targets create facts

Dream or reality, what about the climate targets for 2030 and 2050? It is a fact that the EU wants to limit CO₂ emissions not just from cars alone, but is now setting new limits for lower emissions from buses and trucks.

Target for 2025: -15 % CO₂ emissions vs. 2019

Target for 2030: -30 % CO₂ emissions vs. 2019

Achievable with effective drivetrain technology

These goals can only be achieved with state-of-the-art technology, with alternative drive technologies that are sustainable and convince end consumers, fleet operators and manufacturers alike. ZERO EMISSION – locally emission-free, but also environmentally friendly during production and recyclable.

Advantage KEYOU-inside – meets ZERO EMISSION requirements 100 %

At approx. 0.1 g/kWh, hydrogen engines with KEYOU-inside are massively below the ZERO EMISSION limit defined by the EU. Your truck will, therefore, be able to operate under the „ZERO EMISSION“ label in the future.

Official since June 20, 2019: EU-commission adopts CO₂-limits for utility vehicles (Regulation (EU) 2019/1242)

“zero emission heavy-duty vehicle’ means a heavy-duty vehicle without an internal combustion engine, or with an **internal combustion engine that emits less than 1 g CO₂/kWh** as determined pursuant to Regulation (EC) No 595/2009 and its implementing measures, or which emits less than 1 g CO₂/km as determined pursuant to Regulation (EC) No 715/2007 and its implementing measures;”

KEYOU-inside officially reduces your carbon footprint:

- Save CO₂ certificates
- Reduces the CO₂ fleet balance
- Reduces your company’s CO₂ footprint with KEYOU-inside

Hydrogen – More Efficient than Batteries will ever be

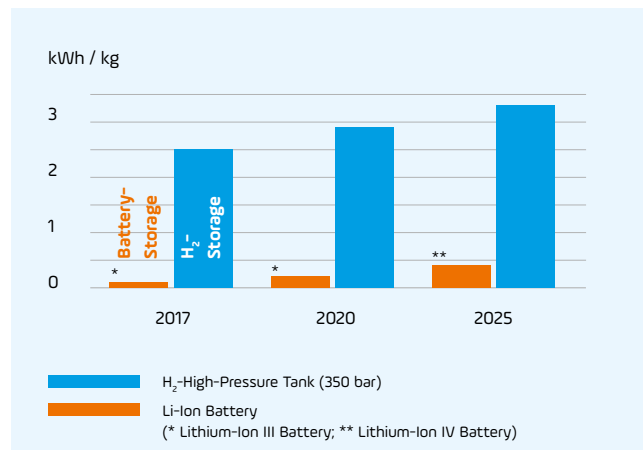

Hydrogen storage is decades ahead of the electric battery solution

Sustainable technology does not only focus on the type of drive, but also on the type of energy storage. For KEYOU this is an additional reason to focus on hydrogen engines.

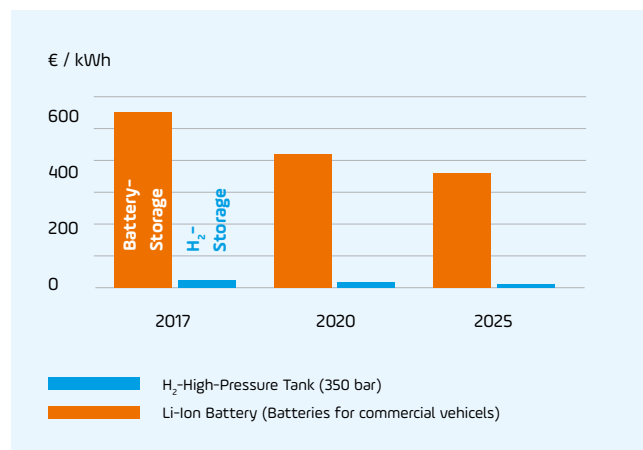

Advantage: Gravimetric Energy Storage Density (energy per mass)

Already today, the 350 bar H₂ high-pressure tanks currently available, have an **energy storage density that is 25 times** higher than that of lithium-ion batteries used in the truck sector.

Advantage: Costs

Another advantage – costs: The price difference is significant. Hydrogen storage is about **23 x cheaper** than battery storage. The cost-advantage of hydrogen storage compared to electric storage is, among other things, the low material cost of the tanks.

Hydrogen – is Safe!

Safety is also a top priority for the hydrogen engine. It requires additional safety measures, but there is no need to rethink the risk awareness. On the contrary, the danger of a fire, e.g. in the event of an accident, is higher if gasoline escapes. Hydrogen storage tanks are very robust. If hydrogen is actually released after an accident, the light gas escapes upwards and the fuel does not collect on the ground, unlike petrol.

Maximum
Performance.

Zero
Emission.

“Thanks to our innovative hydrogen technology, the combustion engine is turning green.”

Hydrogen and the Combustion Engine – A truly “GREEN” Combination

Internal combustion engines – a mature technology with weak points

Everyone knows it, everyone appreciates it, the reliable and powerful combustion engine. The downsides of the mature diesel or gasoline drive: high emissions of pollutants and the related damage to the environment and public health. Solutions using emission-free electric drives and fuel cells are promising, but they show weaknesses in range and suitability for everyday use and cost many times more than diesel vehicles. In addition, current environmental studies have shown that the eco-balance of these approaches must be viewed critically.

Hydrogen engines – sophisticated technology with ZERO EMISSION

KEYOU has used the optimized technology of the diesel engine as a basis to develop a new generation of emission-free hydrogen engines: Sustainable. Clean. Uncompromising.

Prototype engine DEUTZ TCG 7.8 with KEYOU-inside technology

Emission-free – no CO-, CH-, CO₂- and NO_x with hydrogen

The main advantage of hydrogen compared to fossil fuels is the lack of carbon. Exhaust gases such as CO, CH and climate-damaging CO₂ cannot be produced in the first place. NO_x formation is also completely avoided by the lean combustion capability of hydrogen in conjunction with the innovative EGR strategy. In order to increase the power density, an SCR catalyst, that works with hydrogen, can be considered instead of AdBlue.

Efficiency potential – greater than that of diesel engines

This means that the hydrogen engine scores several times over:

- 6 x faster flame burning speed compared to gasoline
- Largest flammability range of all fuels (4-75 %)
- De-throttled motor operation for high efficiency
- With the KEYOU Port Fuel Injection (PFI) engine:
 - > 45 % peak efficiency
 - > Additional increase in efficiency through H₂ direct injection

Power – highest potential at power density and torque

In future generations of the engine, power density and torque can be further increased. The hydrogen-powered engines offer the greatest development potential compared to gasoline and diesel engines.

KEYOU-inside – the New Generation of H₂ Engines

Robust base and innovative technology

The special feature of KEYOU's hydrogen engine is its patented coherent technology approach: efficient injection, exhaust gas recirculation, turbocharging and a special hydrogen catalyst. By using the conventional diesel engine as the base, KEYOU has succeeded in doing something that others have failed to do so far – developing an efficient and economical zero-emission engine with high efficiency and significant customer benefits.

H₂-Combustion concept of KEYOU

H₂-Lean Combustion with EGR

- ✓ No NO_x problem
- ✓ High efficiency

Turbocharged

- ✓ Maximum performance

H₂-Direct Injection

- ✓ High power and torque
- ✓ High efficiency

H₂-Reduction Catalytic Converter

- ✓ Optional upgrade as "KEYOU Air Clean Technology"

Highest Power/Torque Density

- 27 kW/L Engine
- 140 Nm/L Engine

Highest Efficiency

- Higher than basic diesel engine
- Effective peak value of 45 %

Sustainable Air Purification

- 0,0 g CO₂ emissions
- 0,0 g CO_x
- 0,0 g NO_x
- 0,0 g other impurities

Engines with KEYOU-inside – in lean operation on the fast lane

The zero-emission hydrogen engine builds on the robust diesel engine and is modified into a turbocharged, lean, spark-ignited hydrogen internal combustion engine, with high efficiency and high-power density. Using hydrogen as a fuel, engines can operate efficiently up to an air-fuel ratio of $\lambda 5$. KEYOU operates the engine via an air-fuel map that is always larger than $\lambda 2$. In conjunction with an innovative EGR strategy, NO_x formation is completely prevented.

Prevention of NO_x formation – with sophisticated exhaust gas recirculation (EGR)

Compared to diesel engines, hydrogen-powered engines have low EGR usage restrictions because there is no carbon in the fuel. This, together with the fast combustion properties of hydrogen, allows the engine to operate at high EGR rates without compromising efficiency. The formation of NO_x is thus already avoided in the first place.

More power – through turbocharging

In order to compensate for performance losses caused by lean combustion, KEYOU integrates an air charging system tuned to hydrogen. This also provides the required torque in the lower speed range with perfect calibration.

High efficiency – with external mixture formation and direct injection

With KEYOU's current technology, hydrogen is injected sequentially, directly in front of the intake valve. With this technology, engines with intake manifold injection can already achieve a very good efficiency of 45 %. In the next generation of KEYOU's technology, direct injection will be used in order to achieve higher efficiencies and performances.

Zero-emissions and powerful thanks to an H_2 -SCR catalytic converter

Hydrogen engines, with the first-generation KEYOU technology, are already zero-emission vehicles today – without after-treatment of exhaust gases! We are currently developing a special H_2 -SCR catalytic converter, which exclusively uses hydrogen as a reducing agent and allows to increase the power density without compromising on emissions. The fundamentally new catalytic design eliminates the need for additional consumables such as AdBlue.

“We believe in hydrogen as
the fuel of the future.”

KEYOU-inside – a Solution for Humanity and the Environment

Harmless water vapor as exhaust gas – 0.0 emissions in all areas

Due to KEYOU’s special operating strategy, only small amounts of nitrogen oxides are produced, far below the strict Euro 6 emission limits, even without exhaust gas aftertreatment. In the life cycle assessment of electric vehicles, the KEYOU technology is superior to CO₂ in terms of the German electricity mix and the current state of studies on the production and service life of battery systems (Please see the graph on page 16).

In a nutshell: Every vehicle with KEYOU-inside and H₂-SCR is not only environmentally friendly, it also cleans the heavily polluted air of city centers.

18 t truck		Diesel Motor Euro VI ^{***}	H ₂ -Engine by KEYOU
CO ₂	[g/kWh]	1.000	0,08
NO _x	[g/kWh]	0,46	0,04
PM*	[g/kWh]	0,01	0,002
HC**	[g/kWh]	0,16	0,01
CO	[g/kWh]	4	0,01

* Particulate Matter, description / unit / standard for fine dust

** Volatile organic substances such as hydrocarbons

*** Legal requirements

Environmentally friendly – from production to recycling

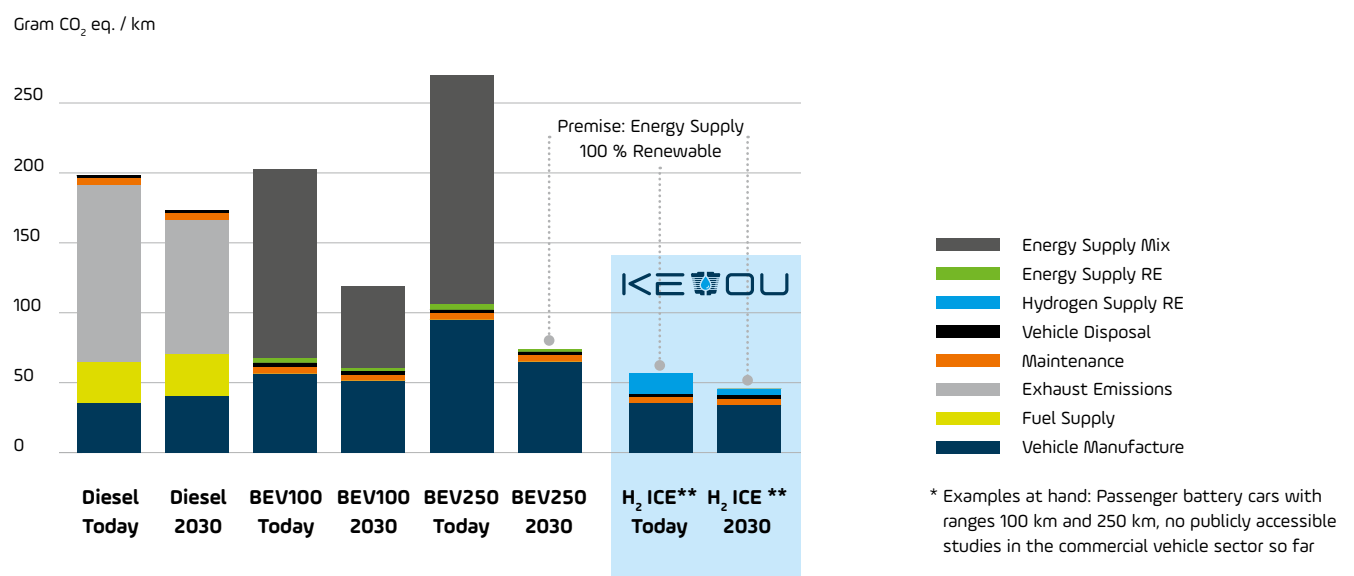

The planet’s raw materials are finite, especially when it comes to precious, rare earth elements. The extraction, use and recycling of toxic raw materials is also highly problematic. Unfortunately, these same materials are produced in much greater quantities during the production of electric vehicles, which also leads to an increased dependency on certain raw materials or producing countries. By contrast, steel, aluminum as well as plastics dominate the market for combustion engines and classic transmissions. A clear plus for sustainability.

KEYOU-inside also stands for the Cleanest Drive Technology over the Life Cycle

Sustainability impact: Clear advantages for KEYOU in the life cycle assessment

Powered by H₂ from renewable energies, a KEYOU drive system has the lowest CO₂ emissions over its life cycle compared to fuel cell or pure electric vehicles. In addition, no rare earth elements such as cobalt are needed for the hydrogen combustion engine.

Refueling? No problem – if required, Hydrogen Truck and Infrastructure are available as a Package

Hydrogen is already sufficiently available today

Hydrogen, as an industrial by-product, is available in large quantities in many regions. At the same time, H₂ production is becoming increasingly environmentally friendly and cost-effective thanks to new processes. Produced with the help of regenerative energies, hydrogen can be offered almost CO₂-neutral. Additional sources can be tapped in waste management through the generation and subsequent reforming of biogas.

Simple refueling

The refueling process and infrastructure requirements of an H₂ filling station are comparable to conventional filling stations. While electric vehicles have a huge variety of charging systems and standards, today there is already a worldwide standard for H₂ tank nozzles. The refueling process is comparable to conventional refueling and takes between 10 and 15 minutes, depending on the storage tank and tank size. Hydrogen refueling is safe. Refueling is only permitted if the tank nozzle and coupling are locked pressure-tight.

No dependence on a nationwide network of filling stations

Fleet operators, forwarders or companies with trucks in classic distribution transport usually refuel their vehicles centrally at the operating site. This eliminates the need for a nationwide network of filling stations. Nevertheless, around 100 new H₂ filling stations, with an investment value of around € 100 million are planned in Germany alone by 2020.

H₂-filling stations as an attractive investment

While the lack of capacity utilization and high hydrogen prices in the passenger car sector have so far been the root cause of gaps in the filling station network, a KEYOU H₂ filling station can offer attractive fuel prices starting from a fleet of ca. 20 trucks with KEYOU inside technology, through guaranteed daily distances and central refueling at its own depot. This ensures shorter payback times and opens up opportunities for intelligent H₂ operator concepts. KEYOU is already working with partners on various solution models in the field of H₂ infrastructure.

H₂ as a by-product of the chemical industry, via electrolysis or biogas reformer from renewable energies

The KEYOU H₂ mobility concept for end customers is already in preparation today

KEYOU is more than an innovative drive technology. When entering the market, KEYOU will also offer H₂ infrastructure solutions together with partners. Don't worry about filling stations and H₂ procurement. KEYOU supports you in the analysis, planning and construction of your H₂ infrastructure.

- ✔ "Emission-free vehicle plus fuel" as a package solution
- ✔ Turnkey filling station concepts for different fleet sizes
- ✔ Consideration of H₂ availability for the end customer

Sustainable. Clean. Uncompromising.

The first hydrogen truck – powered by KEYOU

Its diesel-typical robustness, high efficiency and emission-free operation without exhaust gas aftertreatment, make the hydrogen engine the superior drive unit in commercial vehicles. On top of this is the extremely attractive price/performance ratio compared to other emission-free alternatives currently available.

Unique competitive advantage through KEYOU-inside

Whether diesel, electric or fuel cell trucks – KEYOU offers a unique competitive advantage. Hydrogen engines, with KEYOU-inside, empowers vehicles with maximum performance, zero emissions and all at an affordable price. This makes clean mobility affordable for the customer himself for the first time. All this with the same customer benefits in terms of range, availability, payload capacity or cargo cooling common in diesel trucks. The big winners are people and nature alike.

KEYOU-inside hydrogen engines – the new world of mobility

With KEYOU-inside manufacturers can offer the world's first emission-free hydrogen combustion engine with performance characteristics suitable for everyday use, on economically attractive terms. With the market launch prices, the first trucks with KEYOU-inside can be already operated well below battery and fuel cell trucks without subsidies at total costs. After the successful market introduction, trucks can reach market prices slightly above those of natural gas vehicles in large quantities and, depending on the availability of the local hydrogen source, be operated at attractive overall costs over their service life. This already allows fleet operators to replace current diesel trucks 1:1 by H₂ trucks with KEYOU-inside today.

KEYOU by Comparison: Case 18 t truck

Assumptions: Lifecycle: 1 mio. km (66.000 km p.a.) H ₂ -Price: 5 €/kg (equivalent: 1,51 €/l Diesel)	Alternative Propulsion Technologies			
	Diesel Euro 6	Battery E-Truck	Fuel Cell H ₂ -Truck	H ₂ -ICE KEYOU-inside PFI

Operational lifetime (years)	12	5 (Battery)	4 (BZ Stacks)	12
Consumption (100 km)	24 l	88 kWh	5 kg H ₂	ca. 7 kg H ₂

Assumptions fuel prices: diesel: 1,16 €/L – AdBlue: 40 ct/L – battery: 19 ct/kWh (storage: 100 Wh/kg; storage costs: 500 €/kWh) – hydrogen: 5 €/kg

* Current market price average

** Prospective (calculated) price at series production

*** Including purchasing price, maintenance, fuel, and toll Germany (EU IV: 12,8 ct/km)

For high-volume production, the H₂ engine, which is suitable for everyday use, is even cheaper than a diesel engine of the same design, since OEMs can make use of existing production capacities and infrastructure. Furthermore, it is to be expected that the total cost of ownership (TCO) of the hydrogen combustion engine will continue to decline, partly due to rising diesel prices, which, according to Deloitte, could amount to up to +30 % by 2026, while at the same time H₂ prices are expected to fall.
